Start by filling in instructions in the first column after register renaming, and then fill in the timeline. Physical registers are allocated in the order of: p0, p1, p2, p3, p4, …

Cycle	1	2	3	4	5	6	7	8	9	10	11	12	13	14	15	16	17	18	19	20	21	22	23	24	25

* All instructions have already been dispatched so there will only be EX, MEM, WB stages (no IF or ID).
* Before the loop, s0 is already mapped to p10 and s1 to p11. Both p10 and p11 are ready at this point.
